Diffusion is a physical process that refers to the net movement of molecules from a region of high concentration to one of lower concentration. The material that diffuses could be a solid, liquid or gas. Similarly, the medium in which diffusion occurs could also be in one of the three physical states.

Diffusion is a fundamental factor in both natural and human-made processes. Being a universal physical phenomenon, we deal with it throughout our daily life. "Diffusion is the movement of particles from the area of higher concentration to lower concentration area, continuing until equilibrium is reached" .

The GRADFLEX experiment of ESA has shown that under microgravity conditions a stationary thermodiffusion process is accompanied by giant non-equilibrium fluctuations with size as large as the size of the sample. In the presence of small concentration gradients, the features of the non-equilibrium fluctuations can be described by means of linearized hydrodynamics. However, the linear models are ...
