The gravity separation section removes flash gas and gas liberated as a result of heating the emulsion. The emulsion flows down the down-comer to a spreader, which is positioned below the oil-water interface. Exiting at the bottom of the down-comer, the emulsion rises to the top of the surrounding layer of water.

using vapor-recovery equipment on vessels and tanks Resolve crude-oil emulsions at the lowest effective temperature.

Excessive heat drives condensable vapors from the oil, and they are discharged with the gas. Loss of these light ends lowers the American Petroleum Institute (API) gravity of the oil and simultaneously reduces the oil volume.
