Due to the low resistance of the material aluminium, the spot welding must be carried out with high welding currents within short welding times using a special electrode force programme (Figure 4500.01.03). Constitution of the Oxide Film

4501.01 Introduction to Spot Welding

A form of resistance welding, spot welding is one of the oldest welding processes whereby two or more sheets of metal are welded together without the use of any filler material. The process involves applying pressure and heat to the weld area using shaped alloy copper electrodes which convey an electrical current through the weld pieces.

What is Spot Welding? (A Complete Welding Process Guide)

Resistance Spot Welding. Spot welding is a resistance welding process for joining metal sheets by directly applying opposing forces with electrodes with pointed tips. The current and the heat generation are localized by the form of the electrodes. The weld nugget size is usually defined by the electrode tip contact area.

Resistance Welding Overview - swantec.com

Resistance welding processes are used to join metals and include spot welding, seam welding, flash welding, and projection welding. A diagram of the spot welding process setup is shown in Figure 5.20. An example of a spot-welded joint is shown in Figure 5.21, which shows a cross section of a spot weld between two pieces of 2024 aluminum sheet.

The Handbook is a voluntary effort by the members of the Welding Handbook Committee, the Welding Handbook Volume 1 Committee, and the Chapter Committees. Each chapter is reviewed by members of the American Welding Society's Technical Activities Committee (TAC), Safety and Health Committee (SHC), and other specialists.

One general criterion of resistance spot- welding is that the weld shall have a nugget diameter of $5 \times t/2$, "t" being the thickness of the steel sheet. Thus, a spot weld made in two sheets, each 1 mm in thickness, would generate a nugget 5 mm in diameter according to the $5 \times t/2$ -rules.

The standard integrated spot welding package includes a vertically articulated, six- axis, ES-165 robot with a 165 kg payload. The P-point working envelope is 2650 mm (104 inches). The robot can reach below its own base, and can travel in an arc approximately 360° around the base. However, it is possible to restrict the base axis with hard stops.

SPOT WELDING TECHNICAL INFORMATION Resistance Spot Welding is the joining of overlapping pieces of metal by applying pressure and electrical current. These joints created by resistance spot welding form a "button" or "fused nugget." Resistance spot welds are found typically on flanges, staggered in a single row of consecutive welds.
